

IDENTIFICATION OF TOXIC BACTERIA

Mukesh Tiwari
Astha Pandey

Team ATGC

WHAT IS THE PROBLEM?

Identification of the bacteria which is toxic to human population from the collected drinking water sample by constructing a pipeline

BACKGROUND

Bacteria causes many diseases.

However, not all the bacterias are harmful to human.

BACKGROUND

Bacteria causes many diseases.

However, not all the bacterias are harmful to human.

So, what makes a bacteria harmful?

VIRULENCE FACTOR

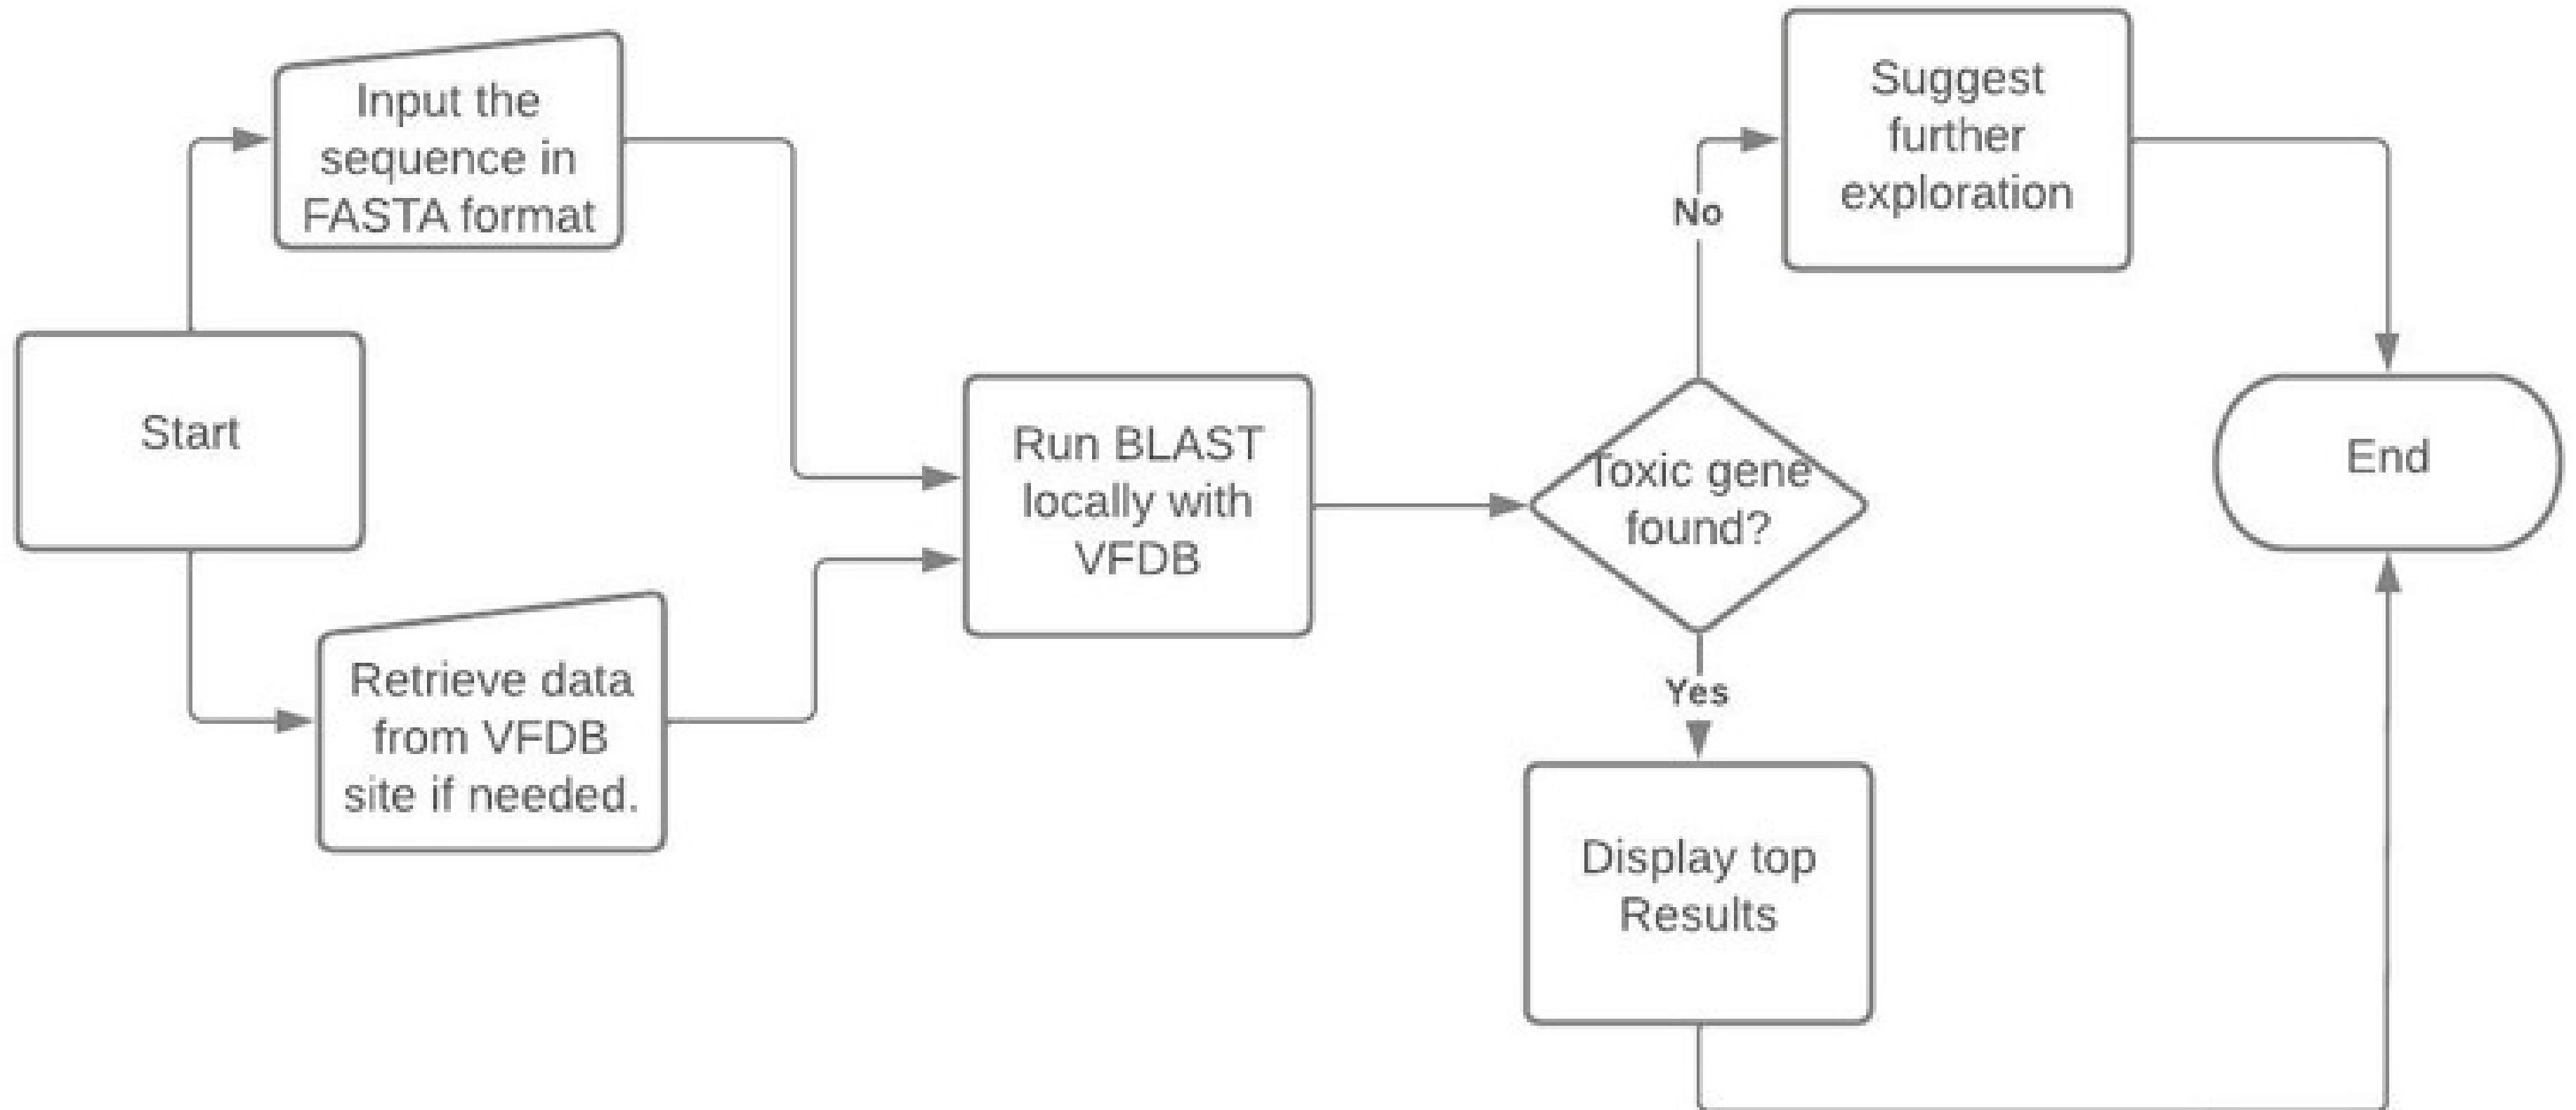

The property of bacteria which increases the **pathogenecity**.

Determined by the portion of the gene that encodes proteins which can cause harm in various ways.

VFDB: <http://www.mgc.ac.cn/cgi-bin/VFs/v5/main.cgi>

Flowchart of Pipeline

PROJECT DEMONSTRATION

COMPLEXITY

Let N be number of entries in database.

Let E be size of entry.

Let Q be size of query.

Then , Time Complexity = $O(N * E * Q)$

Space Complexity = $O(Q + E)$

**a few
seconds**

RUN-TIME

**About 100
mb**

MEMORY

IMPACTS

Offline identification is possible
useful for field sequence analysis in
remote locations.

Easy for Layman

FUTURE POTENTIALS

- Expansion to also consider protein sequences.
- Expansion to be more specialized for nepal
- Disease source identification using location data
